Enroute Cast Away Island - Timbuctoo North Branch - Rancocas Creek Water Trail

Cast Away Island is an isolated partially submerged 15 acres oligohaline wild-rice marsh on the North Branch of New Jersey's Rancocas Creek. It is naturally protected, sheltered and isolated by Rancocas State Park and Long Bridge Burlington County Park.

Bathed by twice-daily tides and constantly flowing past amber Pine Barrens waters, the island sits in the apex of New Jersey's largest remaining colonies of wild rice, hosts eagles, kingfishers, turtles, migrating fish and numerous other wildlife. It also supports year-round multi-use.

For centuries the Rancocas Creek has supported people - from Native Americans to early American intrigue, the underground rail-road and so also 19th-century sand and clay mining. Historic maps and WPA charts show how navigation shaped the Rancocas Creek Cast Away Island maritime cultural landscapes and communities.

Enhanced Awareness

Welcome to Cast Away Island on a Rancocas Creek Tidewater Wild Rice Marsh

Cast Away Island is privately owned by a legally registered 501c3 organization.

Cast Away Island is located 10 miles East of the Delaware River Federal tidal navigation channel. It is 2 miles west of Burlington County's County Seat, historic Mount Holly. Guarded against urban development to the North and West by Rancocas State Park and the State of NJ Rancocas Natural Area. Cast Away Island is flanked on the East and South by Burlington County's Long Bridge Park. Cast Away Island, sentential of isolation preserves, protects and restores a natural ecosystem, naturally.

Here among "green-sand" Cast Away Island is sculpted by expansive quilts of yellow flowering begger-ticks, bounding to life after the natural seasonal cycles of a 1,700 acre wild rice tidewater marsh. NJ's largest remaining colony of wild rice.

Here as bald eagle snap up ducks a plenty, where eels and fishes spawn and migrate to the sea, here where hummingbirds call, here is where we find a peaceful, tranquil symmetry of nature, history, heritage, people and community.

Introduction to the Cast Away Island ERI

This ERI seeks not to plot every detail of the island, but rather provide a lay of the land. The purpose of the ERI is provide a window, a portal into the heart of New Jersey’s natural beauty. This ERI promotes elements of multi-use conservation that we catalogue by eye. These we should not overlook. The ERI is meant to share the knowledge from those who know the wonders, mysteries, the tides, currents, winds , the open spaces and communities of New Jersey’s Rancocas Creek, from the Pinelands to the Delaware River tides.

Growth in South Jersey, in Burlington County and in the Rancocas Creek Watershed expands as populations and communities grow. Pressure is placed on all areas and manner of open space. Sometimes however there is a space, there is a spot, there is a location, 6 miles from the nearest public boat launch that says “hold yer horses”.

We seldom wonder if a creek, a tidewater, a marsh, has its own history, its own story, its own connections to people, place and community. Cast Away Island ERI presents an agreeable variant of multi-use year-round activity that is a path for those who have yet to learn, to see, listen and study field, forest, the water, the tides, the marsh, the creek and ourselves.

This ERI presents a relaxing sociability of Cast Away Island that is worth knowing.

All Photos Unless Otherwise Noted from Cast Away Island

Snapping Turtle Cast Away Island

First, however is location. Maps and Charts of the Cast Away Island ERI

Preamble, the first step in this ERI is to define the precise location of the North Branch Rancocas Creek's Cast Away Island. These maps and navigation charts set the foundation of the Cast Away Island ERI. The brevity of these maps and navigation charts help the reader ascertain location.

The arrangement of the Cast Away Island ERI maps, navigation charts, and a table of contents provides information that portrays Cast Away Island as an exercise on the economy of simple graphics and explanations.

The Cast Away Island ERI opens your immersion into NJ's Rancocas Creek tidewater dynamics fusion with amber flowing pine barrens waters, natural history, ecology, conservation and a more personal inquiry. The ERI is geared to people of all walks of life who want to know more about what happens why, how and when the last remaining hidden niches of New Jersey are exposed.

Lumberton Launch
South Branch

Section One:

Location of Cast Away Island

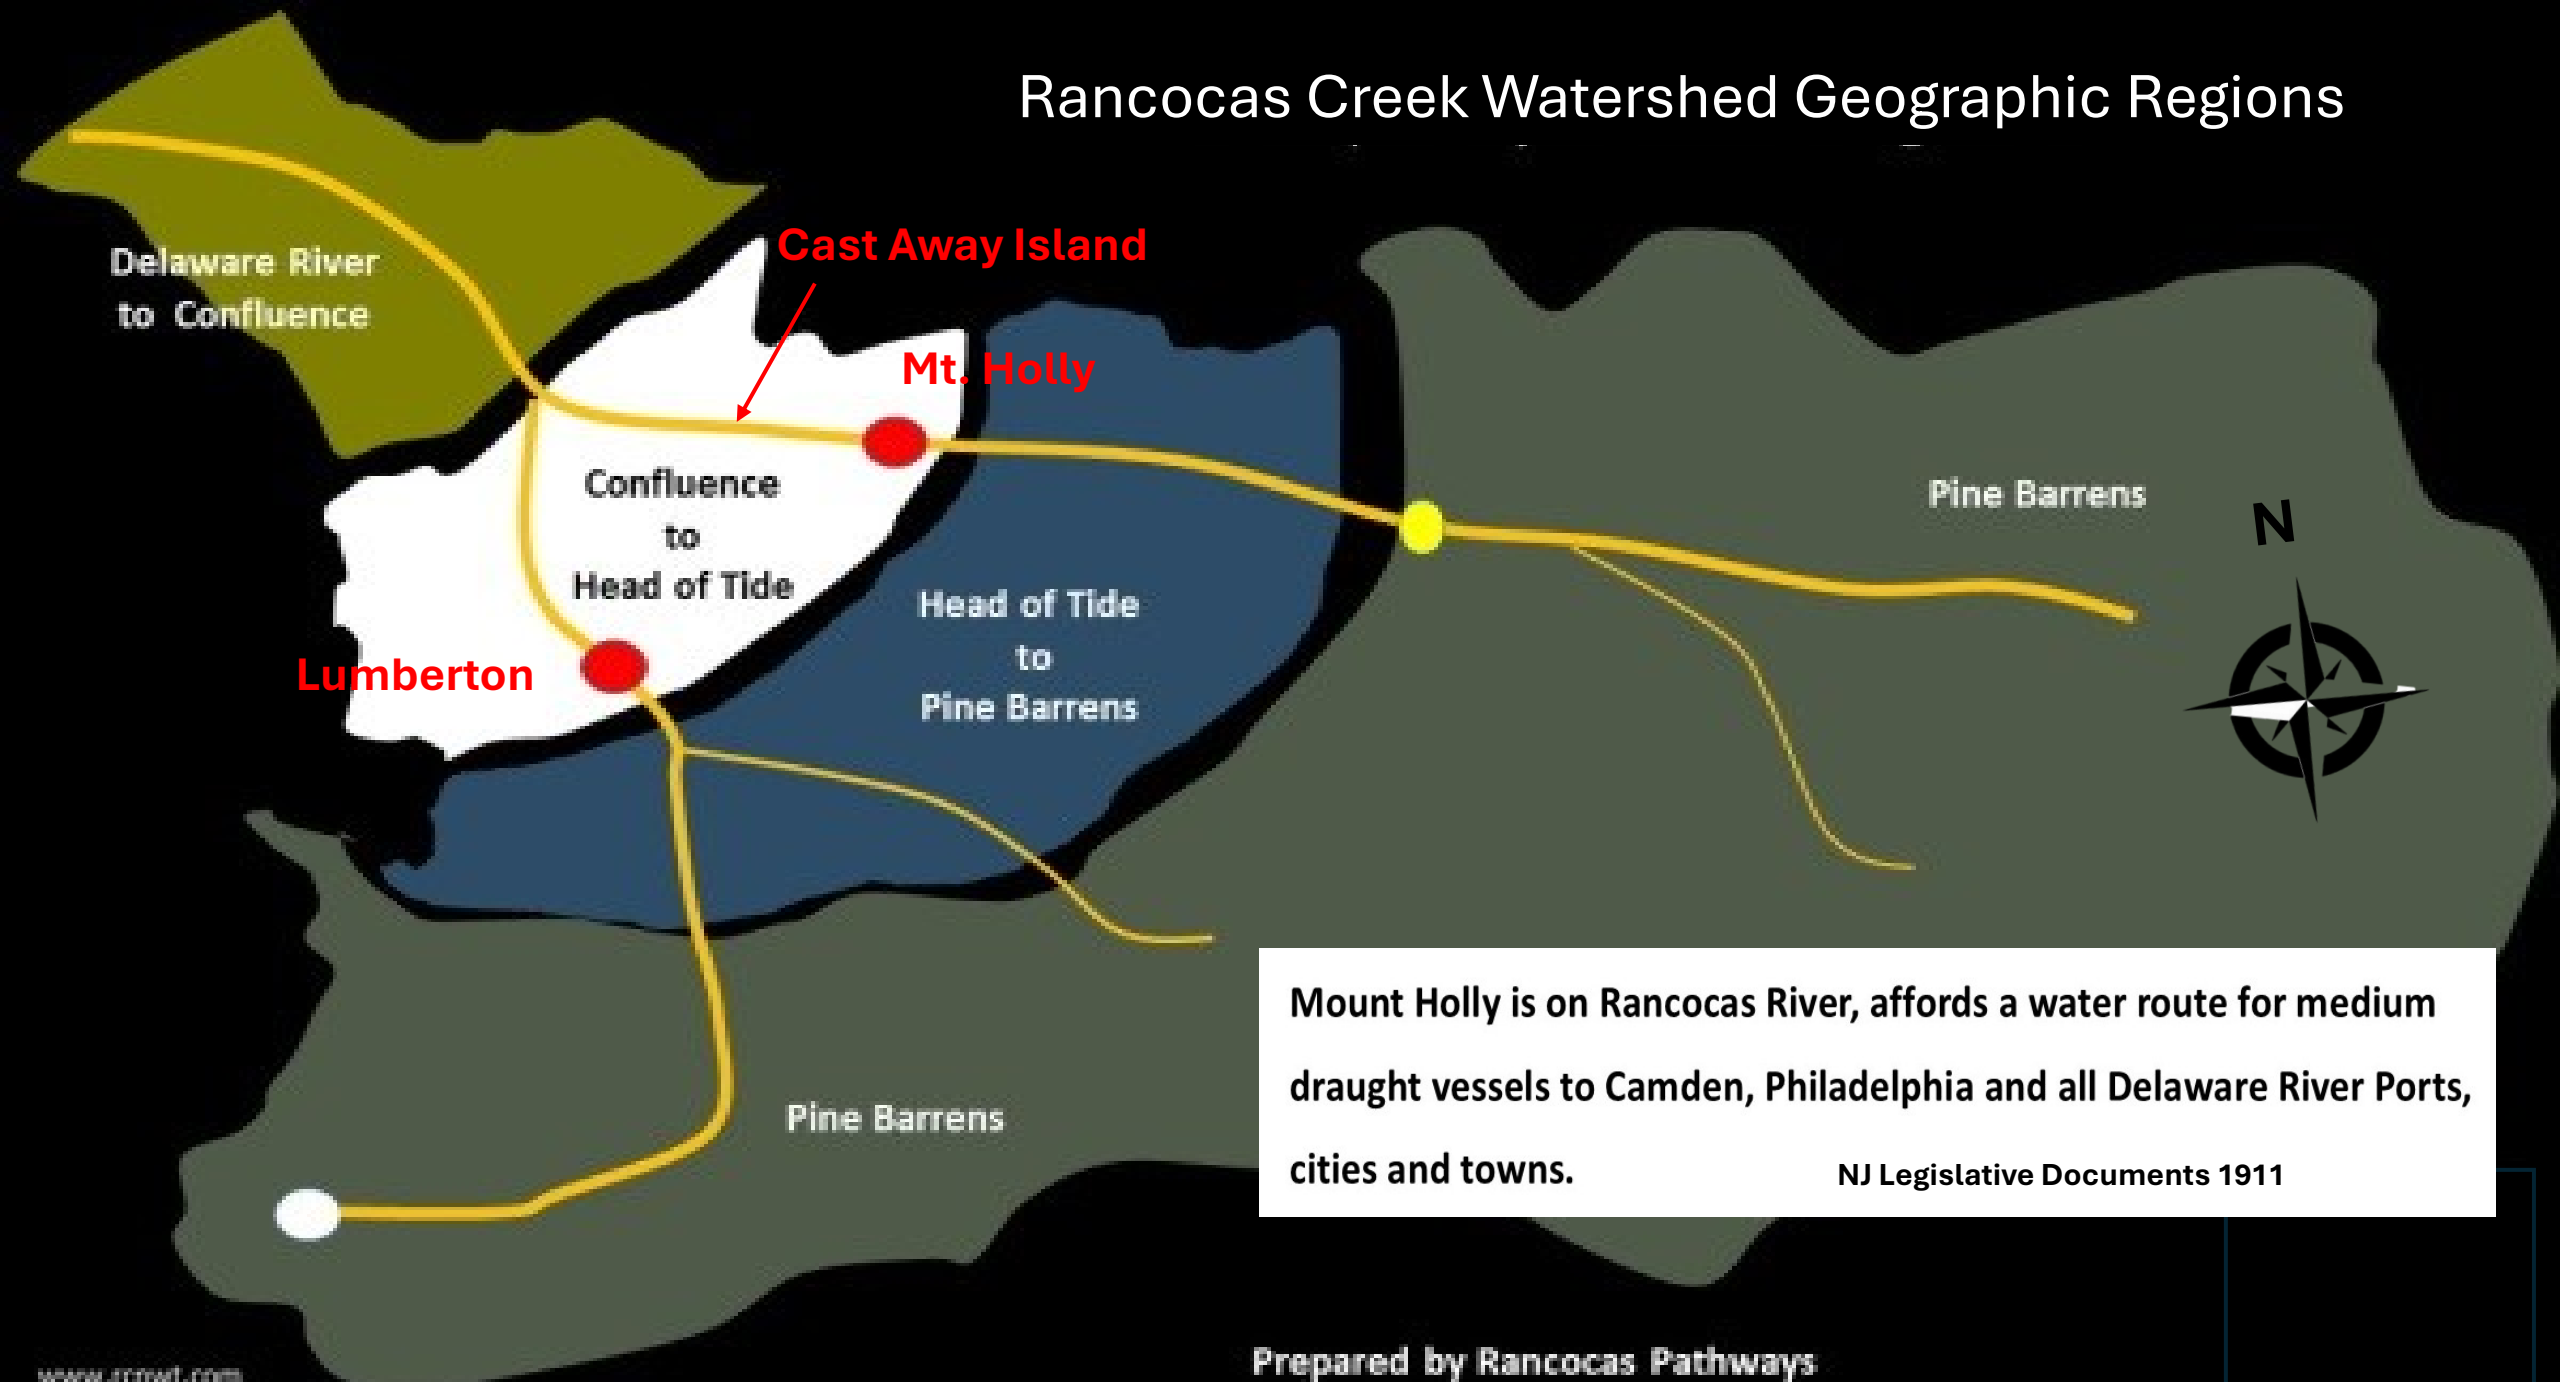

Rancocas Creek drains a 360 square mile bisected watershed. Its headwater sources are found deep inside 3 sub-watersheds of the NJ Pine-Lands National Reserve. Rancocas Creek then slowly winds, meanders and flows across Western New Jersey's outer coastal plain, coursing through pine barrens forested glades, entering the inner coastal plain to join the tide at Mt. Holly on the North Branch and Lumberton on the South Branch.

The tidal reaches of the Rancocas Creek, sailed by Swedes in the mid 1600's and Native American's before, extend in a north-western direction from its Pine Barrens headwaters. The Rancocas tides flow east from Delanco, North of Philadelphia. Here on the tide Rancocas Creek widens, bordered by lush heavily wooded forests and wild rice marshes. These tidewaters connect people to the Burlington County Rancocas Creek Greenway. The Rancocas joins the Delaware River Federal Navigation Channel, Mile 102N.

Rancocas Creek Watershed Geographic Regions

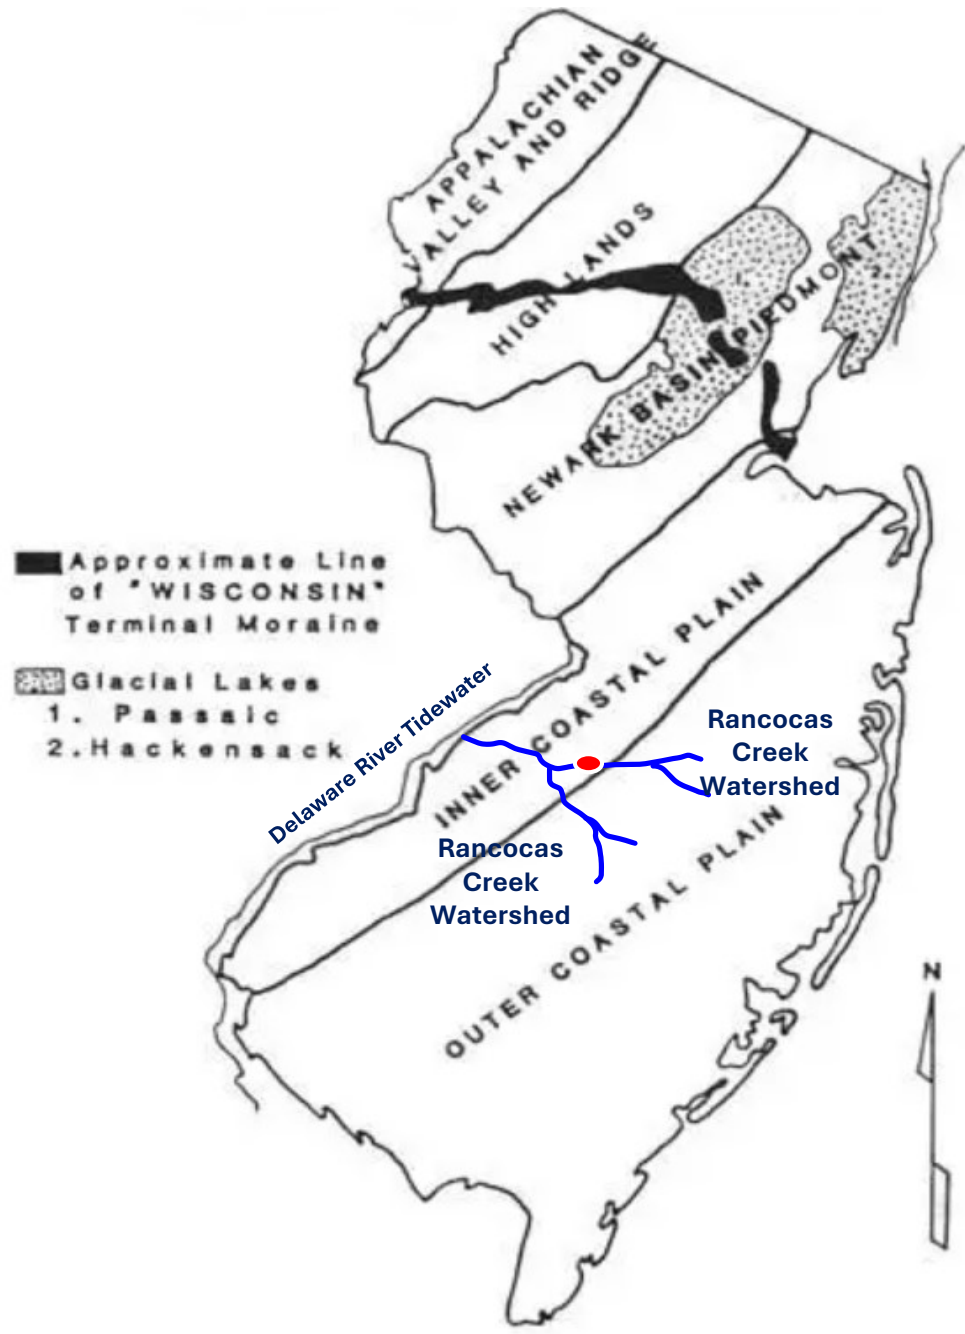

Mount Holly is on Rancocas River, affords a water route for medium draught vessels to Camden, Philadelphia and all Delaware River Ports, cities and towns.

NJ Legislative Documents 1911

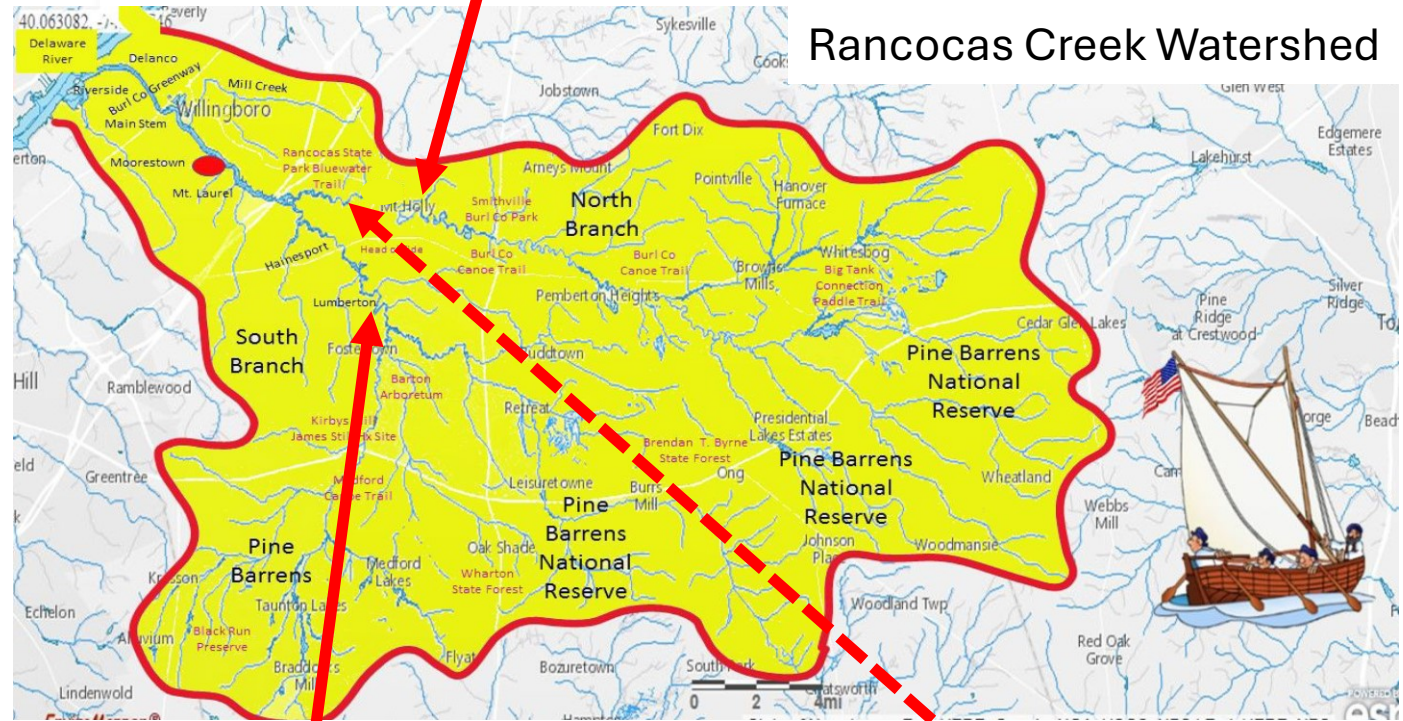

A landscape photograph of a sunrise over a body of water. The sky is filled with dark, layered clouds, with a bright orange and yellow glow from the sun just above the horizon. The water in the foreground is dark, with ripples that reflect the colors of the sky. In the middle ground, there is a dark silhouette of a shoreline with various trees and bushes. In the far distance, a range of mountains is visible under the bright light of the rising sun.

Rancocas Natural Area Management Plan

Adoption Date
September 8, 1998

RANCOCAS NATURAL AREA MANAGEMENT PLAN
PAGE 1

Introduction

The Rancocas Natural Area occupies 58 acres within the Rancocas State Park (Figures 1 and 2). The park is located in Westampton Township, Burlington County, New Jersey, and contains roughly 1,252 acres. The natural area is adjacent to land currently leased from the Division of Parks and Forestry by the NJ Audubon Society for its Rancocas Nature Center (Figure 2).

The management plan provides an outline for conserving and protecting the natural resources and associated values of the Rancocas Natural Area, as summarized in the management objective of this natural area. It provides a brief overview of the physical and biological features of the area and describes the current objectives and concerns for managing the natural area.

The Natural Areas System was established and is administered pursuant to N.J.S.A. 13:1B-15.4 et seq. and N.J.S.A. 13:1B-15.12a et seq. A "Natural Area" is defined as: "an area of land or water, owned in fee simple or as a conservation easement by the Department, which has retained its natural character, although not necessarily completely undisturbed, or having rare or vanishing species of plant or animal life, or having similar features of interest, which are worthy of preservation for present and future residents of the State" (N.J.A.C. 7:5A-1.3). Rancocas was added to the Natural Areas System in 1978 through promulgation of rules associated with the Natural Areas System Act of 1975.

The Division of Parks and Forestry, through Lebanon State Forest, serves as the local agency responsible for administration and implementation of policy and land management practices affecting Rancocas Natural Area. As part of its responsibilities to implement management policies and practices, Lebanon State Forest may consult with other Divisions, organizations and individuals, as well as the ONLM, as necessary to achieve the management objective of this plan.

The Office of Natural Lands Management (ONLM) is responsible for overall administration of the Natural Areas System, promulgation and revision of rules governing System lands, and preparation of management plans. The ONLM also periodically monitors implementation of the management techniques outlined in management plans, and may propose amendments to plans as needed.

Management Objectives and Concerns

The management objective of the natural area is the "preservation of freshwater marsh and southern floodplain habitat, including one of the largest stands of wild rice in New Jersey." Several activities are consistent with this objective:

- Identify the natural area boundary with natural area signs.
- Monitor and assess the impact of public use in the natural area.
- Promote natural resource education in the natural area.
- Maintain and enhance interpretive loop trail.
- Monitor and control erosion on foot paths not maintained as trails.
- Monitor and control invasive exotic species.
- Protect archeological features.
- Maintain and enhance habitat for threatened and endangered species.

Kingfisher
Cast Away Island

Kingfisher Ecology Life Cycle and Native American Myths

The kingfisher holds various symbolic meanings in Native American mythology, reflecting its role as a messenger and a sign of good luck. Among Eastern Woodland Indians, the kingfisher is viewed positively, symbolizing good fortune and abundance. In another legend, a human thief was transformed into the first kingfisher, while in the Siouan tribes, the kingfisher is associated with fertility. Some tribes view the kingfisher as mischief.

The kingfisher's presence is often seen as a sign of balance, freedom, and courage, and it is revered for its association with good luck and joyful spirits. Kingfishers are also considered totems in some Native American cultures, and are used as clan animals in others.

Freshwater Oligohaline Tidewater Marsh

Freshwater oligohaline tidewater marshes are crucial for estuarine and tidewater ecosystems, providing essential habitats for fish, crustaceans, birds, and other wildlife.

Rancocas Creek tidewater marshes and wetlands support a diverse range of species, including important fish and invertebrates, and play a vital role in nutrient cycling and water quality.

Naturally, ecological significance of oligohaline marshes extends beyond their role in fisheries, as they also contribute to the overall health and the year-round multi-use productivity of tidewater ecosystems.

Rare and Endangered Plants of Cast Away Island Intertidal Zone

Smith's Club-rush, *Schoenopectus smithii* S2 (imperiled because of rarity; 6 to 20 occurrences).

Awl-leaf Arrowhead, *Sagittaria subulata* S3 (rare in the state, with 21 to 50 occurrences).

Parker's Pipewort, *Eriocaulon parkeri* S2 (imperiled because of rarity; 6 to 20 occurrences).

Shore Quillwort, *Isoetes riparia* S3 (rare in the state, with 21 to 50 occurrences).

American Waterwort, *Elatine americana* S2 (imperiled because of rarity; 6 to 20 occurrences).

Mississippi Arrowhead, *Sagittaria calycina* S2 (imperiled because of rarity; 6 to 20 occurrences).

Bald Eagles**

Cast Away Island ERI

Bald Eagle Facts

The bald eagle's ecology is deeply intertwined with its habitat and the ecosystem it inhabits. As an apex predator, it plays a crucial role in maintaining ecological balance by regulating fish and small mammal populations, preventing overgrazing of aquatic vegetation, and maintaining water quality. Its scavenging habits also contribute to the decomposition process, recycling nutrients back into the soil, which supports the growth of new plant life. The bald eagle's presence can even influence the behavior of other species, leading to a more diverse distribution of

The large, majestic bald eagle was selected as the U.S. national emblem in 1782 “as a symbol of strength, courage, beauty, and freedom.”¹ During the nesting season, bald eagles are always found close to a water body where a ready supply of fish or waterfowl is available. They typically nest in old, large trees with a clear flight path on one or more sides, and often, a view of the water. The bird’s population in the lower 48 states decreased drastically in the 1960s, from environmental contamination, loss of habitat, and illegal shooting of wildlife.

Biggest threat to Bald Eagles are over-development, loss of habitat, politicians who could care less and people not respecting Eagle’s privacy.

Indicator Species: The Health of Ecosystems

Bald eagles act as an indicator species—a biological marker that reflects the health of the environment. Their population trends can provide insights into the overall ecosystem's condition.

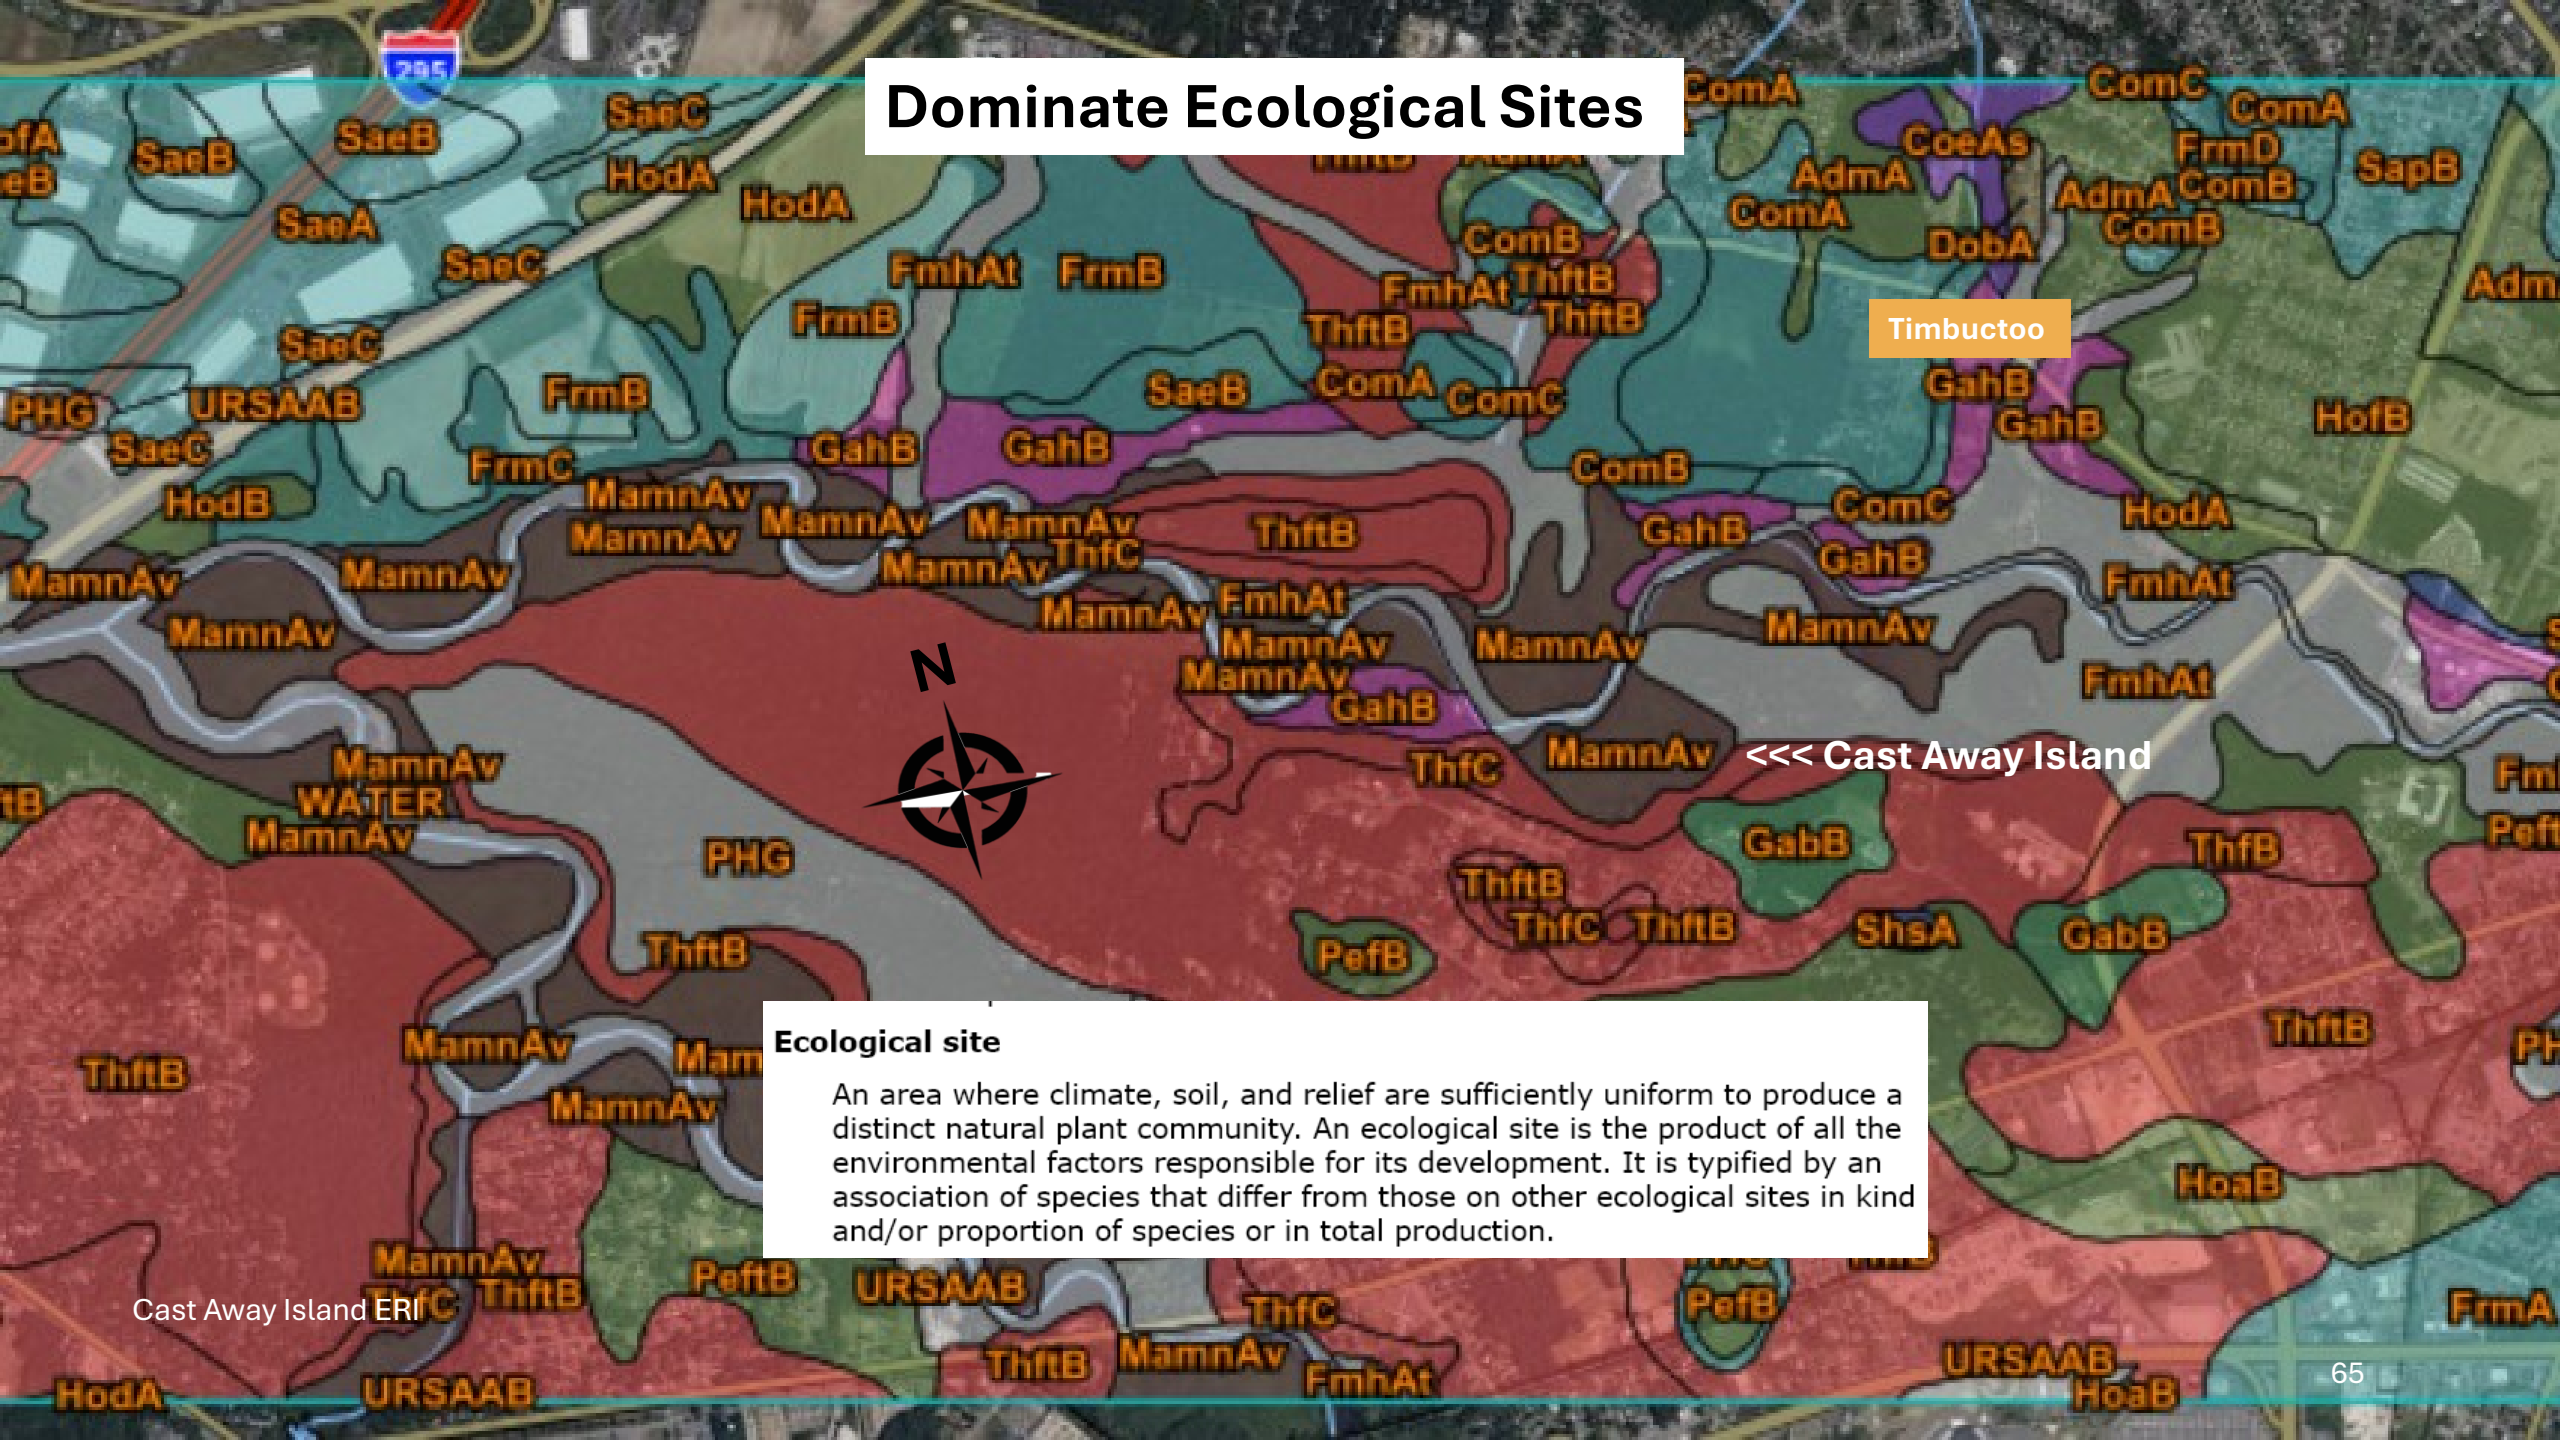

A decline in bald eagle populations may signal environmental issues such as pollution, habitat loss, or decline in prey availability. Monitoring eagle populations, is important for multi-use conservation and managing ecosystems sustainably. A robust population of Bald Eagle's generally indicates a healthy environment capable of supporting diverse populations of wildlife and these connections to multi-use.

Dominate Ecological Sites

Timbuctoo

<<< Cast Away Island

Ecological site
An area where climate, soil, and relief are sufficiently uniform to produce a distinct natural plant community. An ecological site is the product of all the environmental factors responsible for its development. It is typified by an association of species that differ from those on other ecological sites in kind and/or proportion of species or in total production.

Cast Away Island blueback herring

- Spawning migrations of adult alewife and blueback herring have been confirmed in the Rancocas main-stem as well as the north, south and southwest branches..

- Rancocas Creek herring are anadromous (lives in saltwater and returns to freshwater to spawn) and spawn in coastal rivers during the spring. River herring refers to alewife (*Alosa pseudoharengus*) and blueback herring (*Alosa aestivalis*).

- Blueback herring move into coastal rivers during March and April when the water temperatures reach the mid-50s. The spawning site can be from the tidal zone to more than 100 miles upstream. Females release as many as 250,000 eggs in shoreline areas where they are fertilized by the male. Upon spawning, the adults return to offshore areas to overwinter. Newly hatched fish remain in the lower riverine area for several months before moving to sea.

Migration

Medium- to long-distance migrant. Spring migration is earlier than most other shorebirds, with the species beginning to leave South America by late February and arriving in the U.S. 2-3 weeks later. Fall migration is prolonged and variable. Adult Greater Yellowlegs leave around the end of July, with young birds following 4-6 weeks later.

Further details and references to be published

James Logan, Master of the Steamship "Travancore"	}	U. S. D. C.
vs.		E. D. of Pa.
The Ship "Manuel Llaguno," and the Steam Tugs "Newcastle" and "Mary Louise"		In Admiralty No. 9, of 1889

Statement of Facts and Conclusions of
Law

Argument in behalf of the Steamship
"Travancore"

II. That on Sunday, March 30, 1902, the barge Rogers was lying at Hainesport, Rancocas Creek, having on board a cargo of gravel to be carried to a wharf on the Schuylkill River, and that on said day the said barge and the barge "Jennie Bailey" were towed down the Rancocas Creek by the tug Maurice and were moored at Otis Street Wharf on the Delaware River over night.

Libellant's Statement of Facts.

The iron steamship *Treancore* of 1,149 tons registered burden was lying at Point Breeze on the Schuylkill River, February 19, 1889, receiving a cargo of case oil. She was properly moored with her port side against the wharf and bow down stream. By about two o'clock in the afternoon she had received upwards of 53,000 cases of oil, her entire cargo with the exception of some 250 cases, which were then being rapidly loaded. Her pilot had been engaged, was actually on board, and intended taking the steamer down the river as soon as the cargo was all in.

2.

The large American ship *Manuel Llaguno* was towed up the Schuylkill that afternoon by the steam tugs *Newcastle* and *Mary Louise* for the purpose of receiving a cargo of oil at the same wharf as that at which the *Treancore* was lying. The *Newcastle* was lashed upon the starboard quarter of the *Llaguno*, and the *Louise* was towing ahead by a hawser of about twenty or thirty fathoms length and leading out of the ship's starboard bow chock. The master of the *Newcastle* and the master of the *Llaguno* were aboard the latter and the mate was on the forecastle in charge of the tow line. A crew of eight stevedores were also aboard the *Llaguno* under a boss, assisting in shifting her, one of whom was at her wheel, and others on her forecastle under the orders of the mate. As the *Treancore* was not entirely loaded, the master of the *Newcastle* was directed by the Harbor Master employed by the Standard Oil Company

Tug-Boat Mary Louise

1891

It is known from this lawsuit tugboats and tows operated differently on the Rancocas as compared to sand barge tow on the open tidal waters of the Delaware River.

Shorter tow lines on the Rancocas are attributed to the meandering course of Rancocas Creek tidewaters.

Pretty Rancocas' Field.

The banks of the upper Rancocas, that beautiful, winding stream, whose dark cedar waters spring from the pine barrens of interior New Jersey and flow down the Delaware, where they commingle at Delanco, is one of the greatest sections for sand mining in the East. Its banks are dotted with wharves at Barton's landing, Centerton, Rancocas Park, Hainesport and Lumberton. All day long men dig in the fields near by and other men with carts haul the yellow dirt to the wharves, where it is dumped into the waiting barges to be towed to Philadelphia and other points. The bulk of the sand shipped by boat is used for iron molding, while that hauled by train away from the river points is sold for filtration purposes.

THE SAMUEL MILLER SCHOOL AT MOUNT HOLLY, N. J.*

BY NORMAN W. HARKER, ESQ.

The Samuel Miller School is the accomplishment of a task, the furtherance of an idea, and the recognition of a man. Mr. Hart has told you fully of the accomplishment of the task which the growth of the school population of Mount Holly put upon your Board of Education. With the conviction that what was right would in the end prevail, and with some perseverance, the task today stands accomplished. It remains for me to tell you of the idea and of the man: indeed a privilege, for the two most interesting, vital and dynamic things in the world are ideas and men.

The idea is education. It needs no argument nor plea in this community. A town which has given birth or shelter to such educators as John Woolman, John Brainerd, Samuel Aaron, Dr. Samuel Miller, William Collom Cook, Alexander Forbes, Dr. Francis Newton Thorpe, and Dr. James S. Dunham, needs no apostle to arise and champion education. This new building will further that idea and be an equipment for the instruction of future generations in Mount Holly, the potentialities of which can be realized only as the years advance.

If education is worth having in Mount Holly, it is always worth making adequate provision for in this town, the tax rate to the contrary notwithstanding. This seems like a strange statement but it brings me to a phase of this idea of education which I wish to touch upon briefly. Education pays in dollars and cents. It is an old warning that if you hold a penny too

of a valuation which must be counted in six figures. Again, in this day when Mount Holly must bid for its fair share of an increase in desirable residential population from the opening of the Delaware River Bridge, we are able to say to the prospective resident, "We have modern and adequate school facilities for your children," while without this building we were compelled to admit that school facilities were very inadequate. There is no better advertisement for a town than proper school equipment and no worse advertisement than poor and inadequate school facilities. A new school brings growth and development. This new building makes Mount Holly a better town to live in.

Education is also an enrichment of the individual. I will

Barge *Samuel Miller* tied off Tug-Boat *Minerva*

Dr. Samuel Miller was one of the eleven children of the eminent Rev. Samuel Miller, D.D., LL.D., the second Professor in the Theological Seminary at Princeton. The son Samuel Miller was born in Princeton, January 23, 1816, and graduated from the College of New Jersey, in the class of 1833, at the age of seventeen. He served as a tutor in the College in 1835-36. Subsequently he studied law, and practiced at the bar for a short time, but feeling that he was called to a higher duty, he took a course in the Theological Seminary at Princeton, and in October, 1844, was ordained an Evangelist by the Presbytery of New Brunswick. He served the little body of Mount Holly Presbyterians as "stated supply" when he took up his residence at Mount Holly in 1845, and became their regular pastor in 1850. In 1845, he established the West Jersey Collegiate Institute, filling the position of Principal for the twelve years of its existence. After the school was discontinued in 1857, Dr. Miller devoted his whole time to pastoral duties. In addition to devoted service to his Mount Holly congregation, he served the little church at Columbus, as "stated supply," for twenty years ('45 to '65) and until the congregation had grown strong enough to support a regular pastor. For some four years he also supplied Tuckerton and Bass River, making the journey from Mount Holly, forty to fifty miles, through the pines and sand, on horseback, in winter and summer, in fair weather and in storm, ambitious only to further his Master's cause and to serve his fellowmen. From 1865 to 1873 he gave most of his time to the Mount Holly Church, but extended his labors outside as opportunity pre-

March 1909 >>>

Rancocas Creek

Hainesport

The vicinity of Hainesport is probably the greatest sand shipping center on the Rancocas. Here, farms that were abandoned for agricultural purposes are daily turning earth to gold and amassing fortunes for their owners. It is not unusual for these mines to ship twenty barges, each containing 600 tons, a day. At this point more pretentious and labor-saving methods are in use. Huge steam shovels, reminding one of those used on the Panama canal, are continually eating into and down the sand banks until the water line is reached, and which compels them to stop. The ground all around is scattered with the roots of trees, reminding one of the huge spiders, and on the edge of the mine is a growth of small pines and scrub oak, which gives the scene a picturesque appearance.

The main facts are clearly stated in the opinion of the lower court (Record, p. 84) :

“The libellant was the insurer of a cargo of coal amounting to 558 tons that was taken on board the barge ‘Listie,’ to be carried in tow from the Port Richmond coal piers, on the Delaware River, to a wharf on the river Schuylkill. The barge was a hinged, or two-section vessel, each section about 78 feet long, 18 feet beam and 8 feet 4 inches from the water’s edge to the top of the covering board. The capacity of each was from 270 to 278 tons, and on the voyage in question the forward section or box was carrying 269 tons and the after section 289 tons. The voyage began about half-past six o’clock on the morning of August 1, 1908, and proceeded without event for about three miles down the Delaware River, the

PREHISTORIC LIFE IN NEW JERSEY

An interesting array of prehistoric life inhabited New Jersey during the Precambrian, Paleozoic, Mesozoic and Cenozoic time periods. These major eras of geologic time can be characterized by the predominance of certain types of fossils and trace fossils such as dinosaur trackways. Fossils are classified according to their physical characteristics and are evidence of life prior to recorded history. For many fossils, living relatives do exist. In New Jersey, fossils are most abundant in the northwestern part of the state and in southern New Jersey. The map contains images of prehistoric life superimposed on a geologic map. The images are positioned on the map approximately where fossils of the species have been discovered. Many fossils were unearthed during quarrying and construction of roads and buildings. Though most fossil sites are on private property, there are two fossil collecting sites open to the public in New Jersey. Both are located in Monmouth County and include Forcy Park and a site on Big Brook.

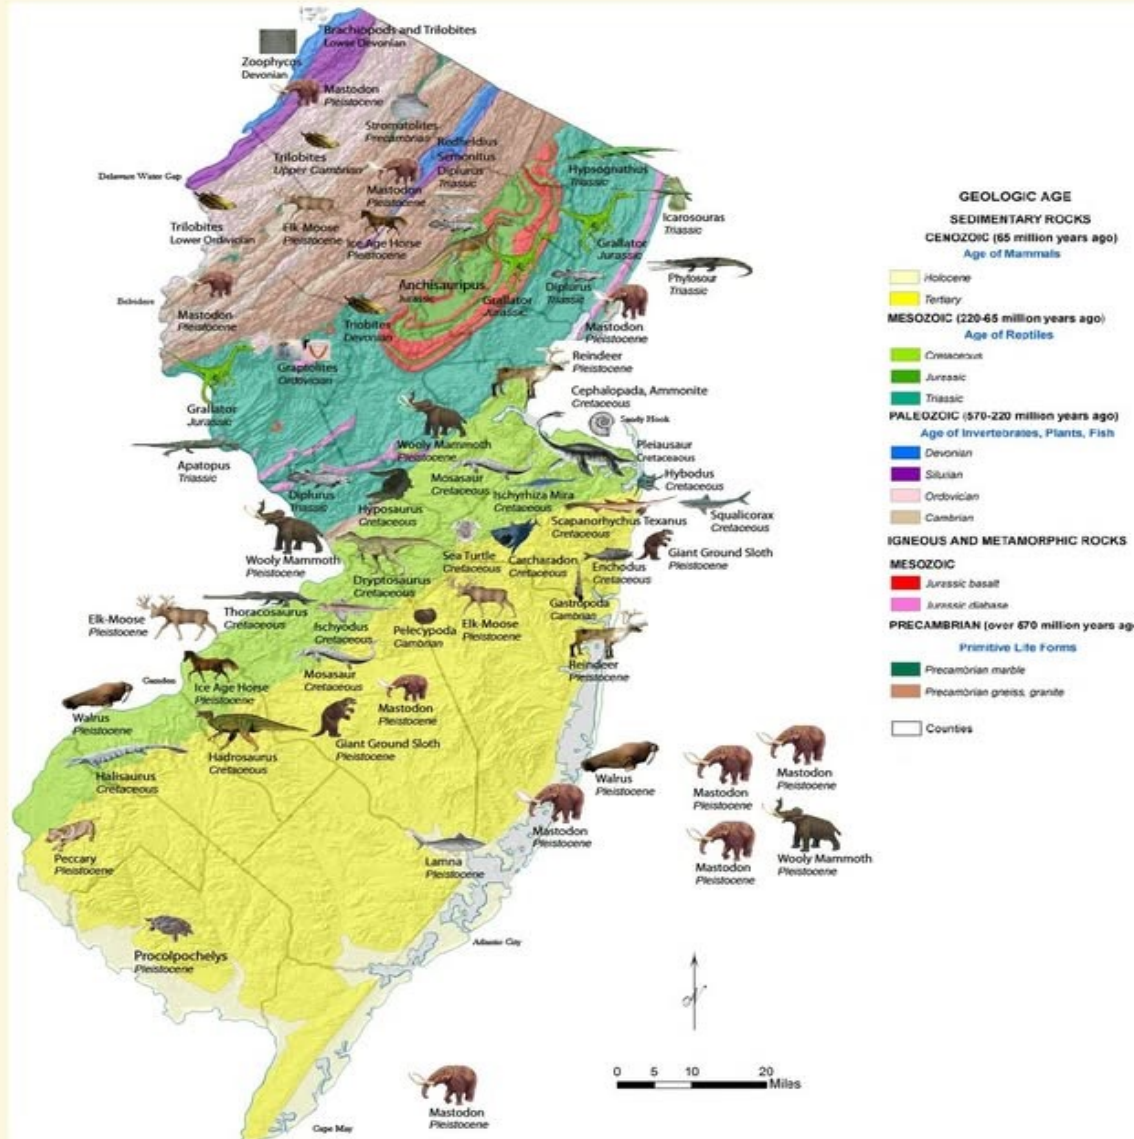

Precambrian: Most of the Precambrian rocks in New Jersey are igneous or metamorphic rocks and do not contain any fossils. However, stromatolites have been found in a 1.2 billion-year-old marble, indicating that marine conditions existed locally in the state at that time.

Paleozoic: Cambrian-age trilobites and stromatolites record the presence of a warm, shallow sea, while deeper water conditions prevailed during the Ordovician. Warm, shallow seas returned to northwestern New Jersey from the Late Silurian into the Devonian. Trilobites, brachiopods, bryozoans, corals, and crinoids are among the common fossils found in this time period.

Mesozoic: Fossils of early reptiles and fish are found in the Triassic sedimentary rocks. Footprints preserved in the sedimentary rocks indicate that bipedal dinosaurs roamed New Jersey during this time. Most of northern New Jersey was above sea level during the Cretaceous, while in southern New Jersey, sea level moved in and out over the coastal plain providing a variety of habitats from estuary to marine. Insect and leaf fossils indicate that low-lying swamps areas were covered by vegetation, while tracks and bones show dinosaurs inhabited the landscape. Mosasaurs, plesiosaurs, sharks, and squid-like animals (nautilus) swam the seas, while clams and oysters thrived on the sea floor below.

Cenozoic: Marine life continued to flourish in the Tertiary seas of southern New Jersey and fossils of brachiopods, shark teeth, echinoderms, and microscopic organisms indicate that the waters were warmer than those of the coast today. Ice sheets advanced and retreated over northern New Jersey during the Quaternary and sea level fluctuated as glaciers alternately grew and melted. Though not shown on this geologic map, the Pleistocene, or Ice Age, ranged from about 1.3 million to approximately 11,700 years ago and was characterized by the formation of widespread glaciers. Mammals included both small forms, such as horses and giant ones such as mammoths and mastodons. They were found in many parts of New Jersey. The mammoths, mastodons and other mammals roamed the land in front of the ice sheets. During this time the coastline of New Jersey extended many miles farther into the Atlantic Ocean than it does today. Some mastodon, mammoth and giant ground sloth remains have been found by commercial fishermen offshore. Almost all of the giant mammals disappeared at the end of the Pleistocene and the start of the Holocene which began 11,700 years ago and continues to the present.

Cast Away Island

North Branch Rancocas Creek

Remains of mid to late 1800's Cast Away Island Wing Dams

Found throughout the Rancocas Creek are piles of stone and brush in the Creek, known as wing dams.

They focus the flow of the Creek to develop a deeper, narrower main channel to aid commercial navigation.

The wing dams comprised the first large scale efforts to improve navigation on the Rancocas Creek as early as the 1700's, along with dredging and removal of tree's shoals and snags. Low flows, shallow areas, and fast moving currents provided obstacles to commercial navigation on the Rancocas Creek.

Wing dams are long narrow berms of alternate layers of rock and brush extending radially into the river from each bank. The brush, usually willow, was tied in bundles and then fastened into mats.

Navigation enhancements and improvements to the North Branch Rancocas Creek, on and around Cast Away Island

In the mid to late 1800's Congress authorized navigation improvements and enhancements to the North Branch of the Rancocas Creek., This was done to meet local and regional demands for inexpensive and reliable transportation between Burlington County and Delaware River Ports. Snags, sandbars, shallows and fast currents delayed and at times stranding and at times sinking Creek steamers, tugboats and barges. Wing dams narrowed the Rancocas, increased its speed and cut through sand-bars and debris.

An example of an early 1900's navigation chart showing wing dams and constructing a wing dam on the Upper Mississippi River Channel. Wing dams are constructed of stones and brush.

1902 a Report to Congress

IMPROVEMENT OF RIVERS AND HARBORS IN SOUTHERN NEW JERSEY, OF CERTAIN RIVERS AND HARBORS IN DELAWARE, AND OF INLAND WATERWAY FROM CHINCOTEAGUE BAY TO DELAWARE BAY, VIRGINIA, MARYLAND, AND DELAWARE.

This district was in the charge of Capt. C. A. F. Flagler, Corps of Engineers. Division engineer, Col. Amos Stickney, Corps of Engineers.

1. Rancocas River, New Jersey.—The Rancocas River is a tributary of the Delaware River, its mouth being about 11 miles above the Pennsylvania Railroad terminal and ferry at Camden, N. J.

In the original condition the minimum depth was 4½ feet at mean low water from the junction of the forks near Centerton to its mouth, a distance of 7½ miles. Above Centerton the depth on the Mount Holly Branch, a distance of 5½ miles, was generally about 2½ feet. From the forks to Moores Landing, the head of navigation on the Lumberton Branch, a distance of 3.6 miles, the low-water depth over shoal places was 3 feet. The mean range of tides at Centerton is about 5 feet.

The original project of 1881 proposed the formation, by a dike at Coates bar and dredging elsewhere, of a channel from 150 to 200 feet wide and 6 feet deep at mean low water from the mouth to Centerton and thence to Mount Holly a channel 5 feet deep. Operations under this project were carried on from 1881 to 1895, and were directed to the formation of a low-water channel 100 feet wide and 6 feet deep from the mouth to Centerton and 50 feet wide and 5 feet deep for a distance of about 1½ miles above Centerton. The unexpended balance, \$399.70, has been returned to the surplus fund of the Treasury.

An appropriation of \$2,000 for this river, made in the act of June 3, 1896, was required by the act to be expended in the improvement of the Lumberton Branch and was applied in the fiscal year 1898 to dredging through the shoals at Pattersons Landing, below Paxsons Landing, and partly through the shoal above Paxsons Landing, the channel having a width of 30 feet and a mean low-water depth of 6 feet, and an appropriation of \$2,000, made in the river and harbor act of March 3, 1899, was likewise required to be expended in the Lumberton Branch and was applied to dredging a channel with a depth of from 6 to 7 feet at mean low water and a width of 30 feet through the shoal below Moores Landing.

The river and harbor act of June 13, 1902, appropriated \$3,000 for continuing the improvement of the Lumberton Branch, and for its expenditure a project was approved providing for the construction of contraction works, consisting of low wing dams, to be located at places where the channel had been dredged and had refilled. The work was completed on July 24, 1903. In all, 18 wing dams were built. Of these, 11 were placed on the north side and 7 on the south side, covering the stretch from the forks up to the highway bridge at Hainesport, a distance of about 2½ miles.

The expenditure during the year was for contingent expenses.

The amount expended on this improvement to June 30, 1905, is \$44,479.45, of which \$6,979.24 was on the Lumberton Branch.

The maximum draft that could be carried June 30, 1905, at mean low water, over the shoalest part of the river between the mouth and the forks and Centerton was 7 feet, and above, to Moores, about 6 feet.

A wing dam is an underwater wall of piling and rock extending from the bank of a waterway into the waterway. Its purpose is to control currents, deepen water over shallows, stop erosion. Wing dams are placed at right angles to a channel. Generally visible at low tide. Boatmen avoid wing dams following the channel. They are indicated by eddies or swirls.

There are two known wing dams on and near Cast Away island

Construction of low wing dams where North Branch Rancocas Creek Channel was dredged. 11 wing dams were placed on the North Branch and 7 on the South Branch

Work on the wing dams commonly began in the winter with the dumping of rock and brush mats on the ice. Wing dams constrict the flow of the channel.

These remains are niches for food for fish and wildlife.

Over the years sediment and sand has filled in the spaces between Rancocas Creek wing dams, providing areas for trees and brush to grow, thus forming fine wildlife habitats. Having a navigation channel consisting of constructing wing dams, digging cutoffs, closing side channels, dredging, and shoreline protection up until the last Congressional funding in the early 1902.

Navigation locks and dams are found on the non-tidal sections of the Rancocas.

Wing dams can be spotted by those on the water and walking along the Rancocas Creek as ripples in the water.

Charles Mather early proponent Rancocas Creek Commercial Navigation

Great interest in improving the Rancocas Creek for Commercial Navigation

Straighten Rancocas Creek for commercial navigation having canals cut-throughs, cut-offs and channel improvements to shorten distance from Delaware River to Mt. Holly.

Early pioneer bringing a steam tug up the Rancocas. Faced tremendous opposition and ridicule. He secured steam-boat and tug. Opened on the first commercial tugboat trips into Mt. Holly.

Opened up Rancocas Creek to larger volumes of maritime traffic to Delaware River Ports: Trenton, Philadelphia & Camden; greater regional, national and world markets.

What is the connection between Stephen Smith, timber broker and (Mather/McIlvaine) lumber business ?

After purchasing his freedom, Smith planned and opened his Lumber business in Columbia, Pennsylvania. Smith would be very successful and looking for partners to grow his business even bigger. In the early 1830s, Smith formed a partnership with William Whipper. Smith and Whipper would have huge success in Lumber, coal, Philadelphia real estate, railroad cars, and investments in the stock market. The two made a fortune and put it to good use, becoming true leaders of the black community in their fight against slavery. In 1830, Smith was the chairman of the African American Abolitionist Organization in Columbia, Pennsylvania. Smith was also ordained in the Mt. Zion A.M.E. Church on South Fifth Street, Columbia, in 1831.

RANCOCAS RIVER, NEW JERSEY.

This river has been improved by the General Government by the formation of a low-water channel 100 feet wide and 6 feet deep from the mouth to Centerton (now called Bougher), near the forks; 50 feet wide and 5 feet deep for a distance of $1\frac{1}{2}$ miles farther upstream on the Mount Holly branch; and thence 25 feet wide and 4 feet deep to Mount Holly. No work has been done on this project since 1895, operations after that year being confined to Lumberton branch.

The district officer submits a plan for further improvement by dredging a channel 10 feet deep and 200 feet wide over the bar at the mouth; 8 feet deep and 100 feet wide to Paxsons wharf at Centerton; thence to Leeds wharf, tapering to 5 feet deep and 40 feet wide; 5 feet deep and 40 feet wide, including several cut-offs between Leeds wharf and King street, and a turning basin near Mount Holly; and 5 feet deep and 30 feet wide between King and Washington streets, Mount Holly, all at an estimated cost of \$83,700, and \$9,300 for maintenance.

THE NEW INDUSTRY.—Allen's Match Factory started yesterday morning in the building on Water Street formerly used as a Creamery. The business will all be transferred from the Centreton Works, where matches have been made a month or two past. When in full operation about 50 hands will be employed, a number of women and girls being included.

Rancocas Crick

By the way, you will hear a great many persons say "crick" instead of "**creek**." But you

Water-Boatman.

will remember that **creek** should no more be called crick than Greek should be called Grick or cheek be called chick.

Crawfish can be caught with a small dip net or with the fingers. When catching them with the fingers it is best to get the first hold. They have ten legs, four small ones on each side, for walking, and two large ones forward, having immense powerful claws for holding their prey. When a crawfish catches a finger it does not let go when asked.

Charles Mather

Rancocas Creek Coal Wars

- 1866 - the “coal ring” at that time, was so strong in Mt. Holly and vicinity that the most extortionate prices were demanded and obtained. Mather was determined to break this.

About the year 1866, thinking there might be a profit in the coal business he entered into it quite extensively, buying in large quantities from the mines and shipping the coal in canal boats from Port Richmond, Pa. to Mt. Holly, N.J. by way of the Rancocas River. The coal ring, at that time, was so strong in Mt. Holly and vicinity that most extortionate prices were demanded and obtained. This he determined to break, if possible, and commenced work to that effect. He secured large orders for coal from the residents of the town at much reduced rates and promised to deliver at certain times. The coal ring was up in arms at once and combined in its efforts to defeat his good aims and plans. Coal at once dropped in price, the dealers even putting coal in cellars and giving long periods of credit to those, who before they would not trust. They did all in their power to shut him out. Still he steadily and boldly pushed his plans to completion, and boat load after boat load was pushed by poles up the narrow and winding Rancocas which was filled with sunken logs, sand bars, and other obstructions. Some boats got to their destination in safety and delivered cargo. Others were snagged and sunk with their cargo on board being a complete loss. Although everything seemed to conspire against him and thwart his plans, he still was not discouraged. Securing more boats and more coal he boldly started out again in his undertaking but luck seemed to be against him. More boats were sunk, more coal lost and, at last despairing of ever accomplishing his desire, he abandoned the enterprise and lent all his energies to the raising of crops and tilling the soil for many years until his health was permanently shattered. He also tried the business of shipping moulding sand from his farm to Philadelphia, but finding there was no profit in it soon discontinued it.

Dealers Testify They Formerly Had a Sort of a Social Organization.

Mr. Moore thought a profit of 25 per cent. should be made. Mr. Moore denied the existence of a Lowell coal club. He said that since July 9, 1902, no recommendation relative to prices had been made to the Lowell Coal company by other dealers. The company made its own prices. Mr. Moore admitted that there had been a club formed in 1897 in Lowell, but that it was more of a social organization than anything else. He did not remember the names of any of the committees of this club, nor did he remember when the club had its last meeting. The club is now disbanded, he said. He thought that there had been no meeting since July, 1902.

Other coal dealers who testified denied the existence of a coal club in Lowell.

The Anthracite Coal Trade of Pennsylvania.

Written by the Hon. CALEB CUSHING, Member of Congress from Massachusetts, for the North American Review, for January, 1836.

for his active and intelligent usefulness, it is Mr. John White, the founder and controlling spirit of the Delaware Coal Company. The consequence of all this has been the rapid growth of a flourishing population, of which Pottsville is the centre, strongly reminding the beholder of the similar results of well applied and well combined capital and industry, as exhibited in the correspondent case of Lowell in Massachusetts.

The immense business of the Schuylkill Valley, it is also interesting to observe, has been growing up simultaneously with that of Lowell, in about the

Strike of Workmen.

BOSTON, March 8.—Owing to a reduction from twenty to fifteen cents per ton, the coal shovelers employed on the wharves of the Lowell Railroad Company, at Chelsea, refused to work, and their places were supplied by other men. This noon about four hundred strikers visited the wharf, and for a time a riot was imminent. The police were called and the rioters dispersed. The men at work will be protected by the police. It is claimed that the men can make at the reduced rate \$5 and \$6 per diem.

MERRIMAC RIVER STEAM TUGS

I am writing a biography of one Eben Moody Boynton of West Newbury, Massachusetts, who, amongst other of his enterprises, lost a fortune on the Merrimac River shipping between Newburyport and Lowell. I am in need of old photos (copy photos are okay) of the 1880 vintage steam tugs "Startled Fawn", "Kitty Boynton" and "Charles L. Mather" and the coal barges "City of Lawrence", "City of Lowell", "Success", and "Defeat". Any leads to any of these would be very helpful.

Richard Albert, 554 Lafayette Ave., W. Trenton, NJ 08628.

SUMMER IDYLL

I was away for three months paddling my inflatable kayak 600 miles along the Canadian and Alaskan coasts from Port Hardy on Vancouver Island to Ketchikan and then to Dall Island. My copies of "Boats" piled up here while I was away. I always enjoy "Boats", as I learn more and experience more, I go back to old copies and find "new" items.

The Coal Strikes.

The coal strike is assuming more formidable dimensions daily. Yesterday an immense mass-meeting was held in Wilkesbarre with representatives from all the adjacent districts. At the conclusion of the meeting a large number of men entered their names upon the roll of the new union amid considerable excitement. A Plymouth miner presented a resolution to the effect that if the wages due the miners employed by the Wilkesbarre Coal and Iron Company for the past month's work, were not paid by Saturday, the men proceed to the company's office and make a determined request for it, which resolution was carried unanimously. It is rumored that by the end of the week there will be an uprising of 25,000 men who have been and are now employed in the collieries in the entire Wyoming and Lackawanna Valleys.

The coal companies were nearly all represented at a meeting held in New York yesterday. Among those present were the Lehigh and Wilkesbarre, the Philadelphia and Reading, the Delaware and Lackawanna, and the Delaware and Hudson. After an informal discussion it was decided to conduct the business on the same general plan as in 1873, making the average increase in price of 10 cents per ton per month. A schedule of prices substantially the same as last year's was adopted for the month of March, considered the opening month of the year in the trade. The Philadelphia Coal Company had no representative present at the meeting. According to the views of prominent dealers no immediate advance in the price of coal need be expected on account of the price, though the April price will probably be higher than last year. The dealers predict a compromise will

add the following list:

WRECK NO. 1.

The schooner *J. B. Clement*, Captain Pearce, came ashore on Deal Beach at 1 o'clock on Friday morning. The vessel was loaded with oysters from Chesapeake Bay, bound for Fairhaven, Conn. She was driven so far on shore that the crew saved themselves by jumping overboard and wading to terra firma.

WRECK NO. 2.

The schooner *G. L. Bradley*, from Philadelphia, with coal for Norwich, Conn., grounded at Ocean Beach about 2 o'clock the same morning. It being high water, the vessel came so near the beach, all on board landed unaided and without getting wet. The crew was composed of Captain Chipman and four men.

WRECK NO. 3.

The three-masted schooner *Maggie McDonald*, from Virginia, with coal, powder and staves, was driven ashore at Spring Lake at half-past 1 o'clock the same morning. The sea was very rough and rolled furiously over the vessel—every wave making havoc on her deck. She soon yielded to the severe pounding and was strewn along the shore. The crew including the captain, L. S. Steelman, had to take refuge in the rigging, from which they were rescued by the crew of Station No. 9.

This makes a list of one brig and four schooners wrecked since Jan. 31st, between Deal Beach and Sea Girt, without any loss of life in either case.

files, as well as to compartment ships and railways. In 1867 he purchased the side-wheel, 120-horse power steam tug, the "Charles L. Mather," of New York, and ran it to Newburyport, and began experimenting to open the Merrimack River for navigation to Lawrence, Mass. He sent to Lowell the first scow-load of coal ever received by water at the harbor of Newburyport, from the Philadelphia & Reading coal steamers; towed it to Lawrence, and passed it through the canal, to Gen. B. F. Butler, at Lowell, Mass. Mr. Boynton has since expended over \$50,000 from the revenues of his saw business in opening up the navigation of the Merrimack, with a view to giving cheaper coal and lumber freights and water transportation to the large manufacturing cities on its banks, where about 500,000 tons of coal are used annually, and manufactures aggregating \$100,000,000 annually are produced. The improvements of the channel, and the delivery of \$80,000 worth of coal by water, caused the railways to reduce their freights in carrying coal to one-half the former charge, on the plea of competition. An opposition so formidable has thus far prevented sufficient capital being embarked to complete an enterprise fraught with so much benefit to the 300,000 people engaged in manufacturing near the summer home of Mr. Boynton; thoughtful men predict that the measure must ultimately prove a great success. The transportation of coal by steam upon the Merrimack, as far as Haverhill, Mass., was first begun by Mr. Boynton and associates in 1864, and has been a constant success ever since, all the coal to Haverhill and the lower towns being now received by water, an indication of the result which enlarged channels and facilities will give to the great manufacturing cities above Haverhill in the near future. In order to admit the deeper draft coal steamers, and open the port for foreign commerce, Mr. Boynton first pro-

observations, undaunted by the prospect that on account of these objections the work would be delayed for years, and the refusal of the War Department to accept his offer to pay for preliminary surveys, Mr. Boynton next procured copies of the surveys of the United States Navy of 1851 and of 1878, and on February 16th, 1879, he forwarded copies of the same, showing the changes of sand at the harbor bar, and giving the data necessary for appropriations. Ten days later the Secretary of War forwarded to Mr. Boynton the approval of General Thom and of the War Department, of his project for constructing jetties at Newburyport, at the mouth of the Merrimack, estimating the cost of granite work as not to exceed \$600,000, and an appropriation was secured, after one rejection, by the committee, of \$50,000 to begin the work. The adoption of Mr. Boynton's plan was complete, and over \$100,000 has since been expended, and granite jetties extend respectively five hundred feet from the southern shore and fourteen hundred feet from the northern shore, and are to be extended four thousand and twenty-five hundred feet respectively, thus compressing the immense waters of the Merrimack and tidal currents by a harbor in the ocean, with an entrance one thousand feet wide. This is the first work of the kind in the section, and its completion will be a monument of granite, as enduring as the continent, to Mr. Boynton's labors in behalf of the Merrimack valley and the ancient historic city of Newburyport.

In 1877, Mr. Boynton was selected by Messrs. George Opdyke, William Orton, Peter Cooper, Wallace P. Groom, John Williams, and other members of the Executive Committee of the New York Board of Trade, to represent the city of New York, at the meeting of the Association of Chambers of Commerce of Great Britain, at Westminster

" OFFICE OF E. M. BOYNTON,
NEW YORK, Nov. 18th, 1879. }

" Hon. GEORGE W. McCRARY, *Secretary of War*,
Washington, D. C.

" Dear sir:—I want a preliminary survey of the mouth of the Merrimack River, near Newburyport. It is desired to extend the narrow channel between Plum Island and Salisbury, continuing it in the same width out to twenty-five feet depth in the sea. By driving double rows of piles and forming jetties, the shifting sands that obstruct the harbor will be prevented, and the confined channel instead of spreading like a fan as it now does, and changing in every storm, will be rendered as deep as it is between Plum Island and Salisbury, where for half a mile it averages thirty-five feet in depth.

Coal steamers of one thousand tons arrive and depart twice each week at great peril, bringing about one hundred thousand tons of anthracite coal this year. About five hundred thousand tons are used in the valley, the population of which is nearly half a million people. About one hundred millions of dollars' worth of products are sent away annually, and it is desirable that the coal and lumber, corn and cotton, in which the entire country is interested, shall have free access. The government has already accomplished much in river improvements, which goes for naught unless the harbor be rendered accessible. I will furnish steamers and men, and pay all the expense, if you will request General Thom to meet me and make the preliminary survey. The coast survey furnishes the principal data needed. I have consulted General Thom, who is alive to the vast importance of the interests involved and the pressing need of immediate action. With great respect, I remain

" Yours, very truly,

(Signed)

" E. M. BOYNTON."

Although this plan was at first objected to on behalf of the government by General George Thorn, Colonel of Engineers U. S. A., on the ground of the magnitude of the cost of the necessary boring, sounding, surveys and current

Penultimate synopsis

Greater awareness fosters a spirit of conservation and activity, naturally. Cast Away Island ERI promotes the fragility of nature and our place in it.

Cast Away Island ERI serves many purposes that enhances multi-use public access. The ERI does not smother the reader with details. We talk about Cast Away Island, we write about Cast Away Island and the ERI shows through maps, charts and pictures: Rancocas Creek's North Branch Cast Away Island.

We encourage questions and involvement. The contents of the ERI puts a face to a unique spot here on NJ's exemplary, quintessential natural resource, the Rancocas Creek tidewaters, naturally.

Conclusion

Thank-you. Here in New Jersey’s “open-space-race” actions speak louder than words. Cast Away Island is an outstanding New Jersey natural, scenic, and heritage natural resource.

Free-market conservation’s approach to Cast Away Island is sensitive to fiscal, environmental, bureaucratic and community interests, naturally.

Cast Away Island cultivates an ethos of year-round, multi-use access here in a quiet, tucked away corner of New Jersey’s 360 square mile Rancocas Creek Watershed.

We welcome others to explore South Jersey’s Rancocas Creek Water Trail. We invite others to visit tidewater natural areas, parks and the Rancocas Creek greenway here in Burlington County.

Ref: NJ Geological Survey , 1926

Sand pit near Manumuskin, Cumberland County. Well-bonded molding sand is dug from above the steep bank and carried in the cars shown to a railroad loading station. "Sharp" sand for foundry use is dug from the lower bank by a dredge operating in the pond shown.

James Stokes, Centeron Sand Mine

Down Creek Hainesport Cast Away Island
Ref: 1926

J. B. Van Sciver, Sr. born in Hainesport, May 14, 1861, with his brother George, developed the Hainesport Mining & Transportation Company, and the De Frain Sand Company.

These companies eventually consolidated into the Van Sciver Corporation. Mr. Van Sciver was also director of the Knickerbocker Lime Company.

By the 1920's these businesses were the premier manufacturers and distributors of building materials in the southern New Jersey/eastern Pennsylvania area.

During World War I, Van Sciver Corporation supplied sand, gravel and concrete to build the Emergency Fleet Corporation's shipyard on Hog Island in the Delaware River. The Van Sciver Corporation was sold to the Warner Company in 1929.

supplies. Unquestionably the factor of greatest importance in boosting production was the operation of the large river dredge, Independence No. 2, by the Warner Company of Philadelphia, at a point on the east bank of Delaware River about a mile and a quarter south of the mouth of Rancocas Creek. By means of a long boom and an endless chain of steel buckets this dredge can dig material from a depth of 40 feet below the surface of the river. As the bank of the river is 5 to 10 feet above water level, that means that for every square yard of property the company has bought, the dredge can dig 45 to 50 cubic yards of sand and gravel—unquestionably an important consideration in the economical operation of the dredge. Moreover, operating on the edge of the river, it has an inexhaustible supply of clean water with which to wash the dredged material—another tremendous asset. A third advantage enjoyed by this operation is that the washed material can be loaded directly into barges and transported to unloading terminals in Philadelphia at very low cost. In view of these advantages and the fact that the material produced is of excellent quality, the continued operation of the dredge seems assured.

(b) River dredge operated by the Warner Company in Delaware River below Riverside, Burlington County.
